QUINOLONE DERIVATIVES

This invention relates to a class of 2(1H)-
5 quinolone derivatives which are substituted in the 3-
position by an optionally substituted aryl substituent.
These compounds are selective non-competitive antagonists
of N-methyl-D-aspartate (NMDA) receptors. More
particularly, the class of compounds provided by the
10 present invention are ligands for the strychnine-
insensitive glycine modulatory site of the NMDA receptor
and are therefore useful in the treatment and/or
prevention of neurodegenerative disorders arising as a
consequence of such pathological conditions as stroke,
15 hypoglycaemia, cerebral palsy, transient cerebral
ischaemic attack, cerebral ischaemia during cardiac
pulmonary surgery or cardiac arrest, perinatal asphyxia,
epilepsy, Huntington's chorea, Alzheimer's disease,
Amyotrophic Lateral Sclerosis, Parkinson's disease,
20 Olivo-ponto-cerebellar atrophy, anoxia such as from
drowning, spinal cord and head injury, and poisoning by
exogenous and endogenous NMDA receptor agonists and
neurotoxins, including environmental neurotoxins.

By virtue of their NMDA receptor antagonist
25 properties, the compounds according to the present
invention are also useful as anticonvulsant and
antiemetic agents, as well as being of value in the
prevention or reduction of dependence on dependence-
inducing agents such as narcotics.

30 NMDA receptor antagonists have recently been
shown to possess analgesic (see, for example, Dickenson
and Aydar, Neuroscience Lett., 1991, 121, 263; Murray et
al., Pain, 1991, 44, 179; and Woolf and Thompson, Pain,
1991, 44, 293) and anxiolytic (see, for example,

- 2 -

US-5145866; and Kehne et al., Eur. J. Pharmacol., 1991, 193, 283) effects, and the compounds of the present invention may accordingly be useful in the management of pain and anxiety.

5 Compounds possessing functional antagonist properties for the NMDA receptor complex are stated in WO-A-91/19493 to be effective in the treatment of mood disorders, including major depression, bipolar disorder, dysthymia and seasonal affective disorder (cf. also
10 Trullas and Skolnick, Eur. J. Pharmacol., 1990, 185, 1). The compounds of the present invention may consequently be of benefit in the treatment and/or prevention of such disorders.

 The association of NMDA receptor antagonists
15 with regulation of the dopaminergic system has recently been reported (see, for example, Werling et al., J. Pharmacol. Exp. Ther., 1990, 255, 40; Graham et al., Life Sciences, 1990, 47, PL-41; Hutson et al., Br. J. Pharmacol., 1991, 103, 2037; and Turski et al., Nature
20 (London), 1991, 349, 414). This suggests that the compounds of the present invention may thus be of assistance in the prevention and/or treatment of disorders of the dopaminergic system such as schizophrenia and Parkinson's disease.

25 It has also been reported recently (see Lauritzen et al., Journal of Cerebral Blood Flow and Metabolism, 1991, vol. 11, suppl. 2, Abstract XV-4) that NMDA receptor antagonists block cortical spreading depression (CSD), which may thus be of clinical
30 importance since CSD is a possible mechanism of migraine. The class of substituted 2-amino-4-phosphonomethylalk-3-ene carboxylic acids and esters described in EP-A-0420806, which are stated to be selective NMDA

- 3 -

antagonists, are alleged thereby to be of potential utility in the treatment of inter alia migraine.

Excitatory amino acid receptor antagonists, including inter alia antagonists of NMDA receptors, are
5 alleged in EP-A-0432994 to be of use in suppressing emesis.

Recent reports in the literature have also suggested a link between the neurotoxicity of certain viruses and the deleterious effects of these viruses on
10 an organism caused by the potentiation of neurotransmission via excitatory amino acid receptors. By virtue of their activity as antagonists of NMDA receptors, therefore, the compounds of the present invention may be effective in controlling the
15 manifestations of neuroviral diseases such as measles, rabies, tetanus (cf. Bagetta et al., Br. J. Pharmacol., 1990, 101, 776) and AIDS (cf. Lipton et al., Society for Neuroscience Abstracts, 1990, 16, 128.11).

NMDA antagonists have, moreover, been shown to
20 have an effect on the neuroendocrine system (see, for example, van den Pol et al., Science, 1990, 250, 1276; and Urbanski, Endocrinology, 1990, 127, 2223), and the compounds of this invention may therefore also be effective in the control of seasonal breeding in mammals.

25 In addition, certain compounds of the invention are antagonists of 2-amino-3-hydroxy-5-methyl-4-isoxazolepropionic acid (AMPA) receptors, also known as quisqualate receptors. An excitatory amino acid projection from the prefrontal cortex to the nucleus
30 accumbens (a particular region of the forebrain possessing dopamine-sensitive neurones) is well known to exist (see, for example, J. Neurochem., 1985, 45, 477). It is also well known that dopaminergic transmission in the striatum is modulated by glutamate (see, for example,

- 4 -

Neurochem. Int., 1983, 5, 479), as also is the hyperactivity associated with presynaptic stimulation of the dopamine system by AMPA in the nucleus accumbens (cf. Life Sci., 1981, 28, 1597). Compounds which are
5 antagonists of AMPA receptors are therefore of value as neuroleptic agents.

A class of 3-phenyl-2(1H)-quinolone derivatives, substituted at the 4-position by an unsubstituted straight or branched alkoxy group
10 containing 1 to 4 carbon atoms and at the 7-position by an unsubstituted straight or branched alkoxy group containing 2 to 10 carbon atoms or by a straight or branched alkoxy group containing 1 to 6 carbon atoms
15 having at least one substituent selected from hydroxy, carboxy and carbamoyl, is described in JP-A-63-295561. These compounds are stated therein to exhibit a strong inhibitory action on bone resorption and a stimulatory effect on ossification, and thus to be useful as
20 therapeutic agents for the prevention and treatment of osteoporosis.

A range of 3-(2-methoxyphenyl)-2(1H)-quinolones, possessing a halogen substituent in the 6- or 7-position and an optional carboxylic acid substituent at the 4-position, is described in J. Heterocycl. Chem.,
25 1989, 26, 281. The compound 4-carboxy-6-iodo-3-phenyl-2(1H)-quinolone is disclosed in J. Chem. Soc., 1929, 2911.

A family of 3-phenyl-2(1H)-quinolone derivatives, substituted at the 4-position by an amino or
30 benzylamino group and at the 7-position by a methyl or methoxy group, is described in Monatsh. Chem., 1982, 113, 751; and Vestn. Slov. Kem. Drus., 1986, 33, 271.

Except for JP-A-63-295561 as mentioned above, none of the aforementioned publications discloses any

- 5 -

therapeutic utility for the various 3-phenyl-2(1H)-quinolone derivatives described therein. Moreover, in none of the prior art documents is there any suggestion that the compounds described therein would be of assistance in solving the problem of providing an effective agent for the treatment and/or prevention of conditions requiring the administration of an antagonist of NMDA and/or AMPA receptors.

The present invention accordingly provides the use of a compound of formula I or a pharmaceutically acceptable salt thereof or a prodrug thereof:

The pharmaceutical compositions of this invention are preferably in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile
15 solutions or suspensions, or suppositories, for oral, intravenous, parenteral or rectal administration. Alternatively, the composition may be presented in a form suitable for once-weekly or once-monthly administration; for example, an insoluble salt of the active compound,
20 such as the decanoate salt, may be adapted to provide a depot preparation for intramuscular injection. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting
25 ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a
30 compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be

- 25 -

readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

In the treatment of neurodegeneration, a suitable dosage level is about 0.01 to 250 mg/kg per day,

- 26 -

preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day. In a particular embodiment, the compounds may be conveniently administered by intravenous infusion.

The compounds of formula I above wherein R represents hydrogen, amino or a group of formula -A-B-E in which A represents a chemical bond and B is a straight or branched alkylene chain containing from 1 to 6 carbon atoms, including the novel compounds according to the invention, may be prepared by a process which comprises cyclising a compound of formula III:

(III)

wherein R¹, R², R³, R⁴, R⁵ and R⁶ are as defined above; and G¹ represents an aldehyde (-CHO) or cyano (-CN) group, or a group of formula -CO-B^a-E in which B^a represents a straight or branched alkylene chain containing from 1 to 6 carbon atoms and E is as defined above.

The reaction is conveniently carried out in the presence of a base, followed by a mild acidic work-up. Suitable bases of use in the reaction include sodium methoxide, sodium hydride and potassium hexamethyldisilazide.

When G¹ in the compounds of formula III above represents an aldehyde group, the product of the reaction

- 27 -

is a compound of formula I wherein R is hydrogen. When G¹ represents a cyano group, the product of the reaction is a compound of formula I wherein R is an amino group. When G¹ represents a group of formula -CO-B^a-E, the product of the reaction is a compound of formula I wherein R is a group of formula -A-B-E in which A represents a chemical bond and B is a straight or branched alkylene group containing from 1 to 6 carbon atoms.

The compounds of formula I wherein R represents a group of formula -A-B-E in which A represents a chemical bond, B is a methylene group and E represents -CO₂R^a may be prepared by intramolecular Michael cyclisation of a compound of formula IIIA:

(IIIA)

wherein R¹, R², R³, R⁴, R⁵, R⁶ and R^a are as defined above; in the presence of a strong base, e.g. sodium methoxide; followed by quenching with a selenyl halide reagent, e.g. phenylselenenyl chloride; and subsequent elimination of selenium to afford the double bond in the 3,4-position.

The intermediates of formulae III and IIIA above may conveniently be prepared by reacting a compound of formula IV with a compound of formula V:

- 28 -

(IV)

(V)

wherein R^1 , R^2 , R^3 , R^4 , R^5 and R^6 are as defined above; G^2 corresponds to the group G^1 as defined above or represents a group of formula $-\text{CH}=\text{CH}.\text{CO}_2\text{R}^a$ in which R^a is as defined above; and Q^1 represents a reactive carboxylate moiety.

15

The reaction is conveniently effected by mixing the reagents in an inert solvent, such as dichloromethane or 1,2-dichloroethane, and heating the reaction mixture at an elevated temperature, for example the reflux temperature of the solvent employed.

20

A compound of formula V wherein Q^1 represents an acid chloride group may conveniently be prepared from the corresponding compound of formula V wherein Q^1 represents a carboxy group $-\text{CO}_2\text{H}$ (i.e. a compound of formula VA as defined below) by treatment with oxalyl chloride or thionyl chloride under standard conditions well known from the art.

30

- 29 -

The compounds of formula I wherein R represents a carboxy group, including the novel compounds according to the invention, may be prepared by a process which comprises reacting a compound of formula VI with a
 5 compound of formula VA:

(VI)

(VA)

wherein R¹, R², R³, R⁴, R⁵ and R⁶ are as defined above.

The reaction is conveniently carried out in the presence of sodium acetate at an elevated temperature, e.g. 200 to 230°C, as described, for example, in J. Heterocycl. Chem., 1989, 26, 281.
 20

The compounds of formula I wherein R represents a group of formula -A-B-E in which A represents an oxygen or sulphur atom or an -NH- group, including the novel compounds according to the invention, may be prepared by
 25 reacting a compound of formula L-B-E with a compound of formula VII:

- 30 -

(VII)

wherein R^1 , R^2 , R^3 , R^4 , R^5 , R^6 , B and E are as defined above; A^{10} represents an oxygen or sulphur atom or an -NH- group; and L represents a leaving group such as a halogen atom, e.g. chloro or bromo.

15 The reaction is conveniently carried out in the presence of a base. When A^{10} represents oxygen or sulphur, a mild base such as sodium bicarbonate is advantageously employed, and the reaction is suitably effected in a solvent such as N,N-dimethylformamide.

20 When A^{10} represents an -NH- group, a preferred base, depending upon the nature of the reagent L-B-E, is sodium hydride or potassium hexamethyldisilazide, and the reaction is advantageously effected in a compatible solvent, such as tetrahydrofuran.

25 In an alternative process, the compounds of formula I wherein R represents a group of formula -A-B-E in which A represents an -NH- group, including the novel compounds according to the invention, may be prepared by reacting a compound of formula H_2N-B-E , wherein B and E are as defined above, with a compound of formula VII

30 above wherein A^{10} represents an oxygen atom.

The reaction is conveniently effected by heating the reagents together at the reflux temperature of the mixture, as described, for example, in Vestn.

- 31 -

Slov. Kem. Drus., 1986, 33, 271; or, if necessary, by maintaining the reaction mixture at an elevated temperature for several days in a sealed tube.

A given intermediate of formula VII above wherein A¹⁰ represents sulphur may be prepared from the corresponding compound of formula VII wherein A¹⁰ represents oxygen by treating the latter compound firstly with N,N-dimethylthiocarbamyl chloride and then with a mineral acid such as hydrochloric acid, followed by hydrolysis with base, e.g. sodium hydroxide, by analogy with the procedure described in WO-A-91/01973.

The intermediates of formula VII above wherein A¹⁰ represents oxygen may be prepared by the procedures described in EP-A-0481676, or by methods analogous thereto. Additional sources of reference for preparing compounds corresponding to those of formula VII above wherein A¹⁰ represents oxygen include, for example, J. Heterocycl. Chem., 1975, 12, 351; and ibid., 1988, 25, 857.

The aromatic intermediates of formulae IV, V, VA and VI above, where they are not commercially available, may be prepared by the methods described in the accompanying Examples, or by methods analogous thereto which will be readily apparent to those skilled in the art.

As will be appreciated, the compounds of formula VII above wherein A¹⁰ represents an -NH- group, which can be used as intermediates in the preparation of compounds in accordance with the present invention, are themselves compounds according to the invention. It is to be understood that any compound of formula I, IA or IB initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further desired compound of formula I, IA or IB

- 32 -

respectively using techniques known from the art. For example, a compound of formula I initially obtained wherein R is carboxy may be converted into a corresponding compound of formula I wherein R represents a C₁₋₆ alkoxy carbonyl group by standard esterification procedures common in the art.

Where the above-described processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The compounds may, for example, be resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-l-tartaric acid followed by fractional crystallization and regeneration of the free base. The compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene & P.G.M. Wutts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds according to the invention.

The compounds useful in this invention potentially and selectively block responses to NMDA and/or AMPA in a brain slice from rat cortex, and inhibit the binding of agonists and antagonists to the strychnine-insensitive site present on the NMDA receptor and/or AMPA binding to rat forebrain membranes.

10 Cortical Slice Studies

The effects of compounds of the invention on responses to NMDA and AMPA were assessed using the rat cortical slice as described by Wong et al., Proc. Natl. Acad. Sci. USA, 1986, 83, 7104. The apparent equilibrium constant (K_b) was calculated from the righthand shift in the NMDA or AMPA concentration-response curves produced by the compound under test. Of those compounds of the accompanying Examples which were tested, all were found to possess a K_b value in response to NMDA of below 150 μM .

Binding Studies

The ability of test compounds to displace ^3H -L-689,560 (trans-2-carboxy-5,7-dichloro-4-phenyl-aminocarbonylamino-1,2,3,4-tetrahydroquinoline) binding to the strychnine-insensitive glycine site present on the NMDA receptor of rat forebrain membranes was determined by the method of Grimwood et al., Proceedings of The British Pharmacological Society, July 1991, Abstract C78.

30 The concentration of the compounds of the accompanying Examples required to displace 50% of the specific binding (IC_{50}) is below 50 μM in each case.

dispersion of sodium hydride (0.14g). The reaction mixture was heated to 60°C, stirred for 90 mins then 7-chloro-4-(2-methoxycarbonyl)ethyl)-3-phenyl-2(1H)-quinolone was added (Example 37, 0.50g) and the reaction mixture was stirred at 60°C for 3h. After allowing to cool, the mixture was poured into water (100ml) and extracted with ethyl acetate (3 x 75ml). The combined organic layers were washed with 1N citric acid (1 x 75ml), water (1 x 75ml), saturated sodium hydrogen carbonate solution (1 x 75ml) and brine (1 x 75ml), then dried (MgSO₄), filtered and the solvent was removed in vacuo to leave a solid residue. Recrystallisation from an ethyl acetate/methanol mixture gave the title compound as a white solid (0.08g). Mp 235-238°C.
